A;Title: An alternatively processed mRNA from the avian c-erbB gene enco. A;Reference number: A42032; MUID:92123214; PMID:1732751

A;Accession: A42032

A;Status: preliminary

A;Molecule type: mRNA

A;Residues: 1-527 <FLI>
A;Cross-references: GB:M77637; NID:g211737; PIDN:AAA48759.1; PID:g211738

A;Experimental source: liver

A;Note: sequence extracted from NCBI backbone (NCBIN:76892, NCBIP:76893)

C;Superfamily: epidermal growth factor receptor; protein kinase homology

C;Keywords: ATP; growth factor receptor

immunostimulatory fusion protein comprising the intracellular domain HER-2 and an antigen elicits an immune response to the antigen and useful for the treatment of associated cancer associated -

Claim 7; Page 26; 59pp; English.

immune response to the antigen. IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HER500 hGM-CSF fusion protein construct which comprises human PAP signal sequence, mature PAP protein, an Ala Arg linker, human HER-2 signal sequence, mature HER-2 membrane distal extracellular and intracellular domains, an Ala Ala linker, a mature human granulocyte-macrophage colony stimulating factor (GM-CSF) sequence and a The invention relates to immunostimulatory fusion proteins (IFP) and nucleic acid molecules encoding such proteins. The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC) induced T-cell mediated cellular tag.

               nucleic acid molecules encoding such proteins. The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC)-induced T-cell mediated cellular immune response to the antigen. IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HER500 fusion protein construct which comprises human pAP signal sequence, mature PAP protein, an Ala Arg linker, human HER-2 signal sequence, mature HER-2 membrane distal extracellular and intracellular domains and a C-terminal tag.

The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC)-induced T-cell mediated cellular immune response to the antigen. IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HER300 rGM-CSF fusion protein construct which comprises human PAP signal sequence, mature PAP protein, an Ala Arg linker, human HER-2 membrane distal extracellular domain, an Ala linker, a novalbumin (OVA)-derived immunodominant octapeptide, an Ala linker, a HER-2 membrane distal intracellular domain, a mature.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to immunostimulatory fusion proteins (IFP) and nucleic acid molecules encoding such proteins. The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective idendritic cell (DC) induced T-cell mediated cellular immune response to the antigen. IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HER500 fusion protein construct which comprises human PAP signal sequence, mature PAP protein, an Ala Arg linker, human HER-2 signal sequence, mature HER-2 membrane distal extracellular domain, an Ala Ala linker, an ovalbumin (OVA)-derived immunodominant octapeptide, upper 2 membrane distal extracellular domain.

                                                                                                                                                            The invention relates to immunostimulatory fusion proteins (IFP) and nucleic acid molecules encoding such proteins. The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC)-induced T-cell mediated cellular immune response to the antigen. IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HER500 rGM-CSF fusion protein construct which comprises human PAP signal sequence, mature PAP protein, an Ala Arg linker, human HER-2 signal sequence, mature HER-2 membrane distal intracellular domain, an Ala Ala linker, a mature PAP and a granulocyte-macrophage colony stimulating factor (GM-CSF) sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Chimeric - 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                          CC comprising administering an antibody which binds Errb2 (HER2; AAB60408).

CC In particular, the anti-Errb2 antibody is the murine monoclonal antibody CC 224 (AAB60396, AAB60397) or a humanised version of 224 (AAB60398.

CC AAB60399). The invention also encompasses an isolated nucleic acid CC encoding a humanised ErbB2-binding antibody; vectors and host cells CC comprising such nucleic acids; the recombinant production of a humanised CC ErbB2-binding antibody and a cytotoxic drug. The ErbB2-binding antibodies CC act by antagonising ErbB receptors, and as inhibitors of transforming CC growth factor alpha (TGF-alpha)-activated mitogen activated protein CC kinase (MAPK). The method of the invention is used for treating cancer, CC especially colon cancer, rectal cancer, colorectal cancer (especially colon cancer, rectal cancer), or breast cancer (especially CC uses e.g., as affinity purification agents. Using an antibody which binds to ErbB2 to treat cancer is preferable to the use of EGFR-targetted CC drugs, as EGFR is also highly expressed in other tissues such as the CC liver and skin, where the active drugs. Antibodies which bind CC ErbB2 are anticipated to have a better safety profile than such drugs.

CC The present section of the profile than such drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  light chain variable region; cancer; cytostatic; EGFR-exprepidermal growth factor receptor; colon cancer; rectal carcolorectal cancer; non-small cell lung cancer; metastatic
                                                                                                                                                                                                                                                                                                                                                                                                                               wherein the cancer expresses epidermal growth factor receptor (EGFR)
                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method for treating cancer in a human patient,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 1; Fig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating cancer in a human, where the cancer expresses epidermal growth factor receptor (EGFR), comprises administering an antibody which binds

                                       The ErbB family of receptor tyrosine kinases are important mediators of cell growth, differentiation and survival. The receptor family includes four distinct members including Epidermal Growth Factor Receptor (EGFR of ErbB1), HER2 (ErbB2 or pl85°neu), HER3 (ErbB3) and Her4 (ErbB4 or tyro2). The present invention relates to a method for treating prostate cancer. The method comprises administering an antibody which binds ErbB2 and blocks ligand activation of an ErbB receptor. Preferably, the antibody blocks binding of monoclonal antibody 2C4 to ErbB3 and/or blocks. The method comprises and/or blocks in the interpretation of mitogen-activated protein kinase (MAPK). The

                                                                                                       The present sequence is the extracellular HER-2/neu protein. HER-2/neu is a member of the tyrosine kinase family of receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (EGRR). It probably plays a part in cell growth and/or differentiation. The HER-2/neu gene is an oncogene. An HER-2/neu fusion protein comprising a HER-2/neu extracellular domain fused to a HER-2/neu phosphorylation domain may be used to treat or prevent cancer by eliciting or companion of the protein companion.

```

The present sequence is that of the extracellular domain of human Her-2/neu (p185 glycoprotein or c-erb82), an oncogenic self-protein and target for anti-cancer vaccines. The Her-2/neu gene is amplified and p185 is overexpressed in a variety of cancers, including breast, ovarian, colon, lung and prostate cancer. Her-2/neu (see AAM51143) is a member of the tyrosine kinase family of receptor-like glycoproteins. It comprises an extracellular domain with homology to the epidermal growth factor receptor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ovarian cancers. The invention provides Her-2/neu fusion proteins, nucleic acids encoding them, viral vectors, and vaccines comprising the fusion proteins or nucleic acid molecules. In preferred fusion proteins, the extracellular domain of a Her-2/neu protein is fused to a Her-2/neu intracellular domain of munne phosphorylation domain (or its DeltaPD fragment). An immune response to Her-2/neu protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by transfecting cells of an animal ex vivo with a nucleic acid encoding the fusion protein, and delivering the transfected cells to the animal. The fusion proteins, nucleic acids, and isolated specific T-cells are useful for inhibiting the development of a cancer, especially breast, ovarian, colon, lung or prostate cancer in a patient. T cells that specifically react with a Her-2/neu fusion protein can be used to remove tumour cells from a sample in
